Normal Exam, FSK 116, 21 June 2023      Page 10/13

3.3 The linear density of a rod, in g/m, is given by  $\lambda(x) = 40.0 + 30.0x$ . The rod extends from the origin to  $x = 0.400$  m. What is the location of the center of mass of the rod? Start off by calculating the total mass of the rod.

W. i. s. f. ...  $M = \int_0^L \lambda(x) dx = \int_0^{0.4} (40.0 + 30.0x) dx$

$$= \left[ 40.0x + \frac{30.0x^2}{2} \right]_0^{0.4} = 40.0(0.4) + \frac{30.0(0.4)^2}{2} = 16.0 + 2.4 = 18.4 \text{ g}$$

$X_{cm} = \frac{1}{M} \int_0^L x \lambda(x) dx = \frac{1}{18.4} \int_0^{0.4} x(40.0 + 30.0x) dx$

$$= \frac{1}{18.4} \left[ \frac{40.0x^2}{2} + \frac{30.0x^3}{3} \right]_0^{0.4} = \frac{1}{18.4} \left[ 40.0 \frac{(0.4)^2}{2} + 30.0 \frac{(0.4)^3}{3} \right]$$

$$= \frac{1}{18.4} [8.0 + 6.4] = \frac{14.4}{18.4} = 0.7826 \text{ m}$$

#### QUESTION 4 [17]

4.1 When  $\theta$  is small, the motion of a simple pendulum can be modeled as simple harmonic motion (SHM) about the  $\theta = 0^\circ$  equilibrium position. Consider a mass  $m$  attached to the ceiling through a massless and non-stretchable cord. The force of gravity and the tension  $T$  are the only forces acting on the pendulum. If, at some instant in time, the pendulum is given a small displacement  $\theta$  from the equilibrium position, derive an expression for the second order ordinary differential equation (for  $\theta(t)$ ) governing the motion of the pendulum.

$\sum F = ma$  ...  $F = -mg \sin \theta$  is the restoring force, forcing  $m$  to its  $\theta = 0$  position.

$$-mg \sin \theta = m \frac{d^2 \theta}{dt^2}$$

For small  $\theta$ ,  $\sin \theta \approx \theta$

$$-mg \theta = m \frac{d^2 \theta}{dt^2}$$

$$\frac{d^2 \theta}{dt^2} + g \theta = 0$$

Surname: Name \_\_\_\_\_

$$V_{P_1} = \frac{1}{2.0 \text{ kg}} \left( (00010 \text{ kg}) (1000 \text{ m/s} - 400 \text{ m/s}) \right)$$

$$= 3.0 \text{ v-v/s}$$

3.2 Three particles are placed in the  $xy$  plane. A 30 g particle is located at (3.0, 4.0) m, and a 40 g particle is located at (-2.0, -2.0) m. Where must a 20 g particle be placed so that the center of mass of the three-particle system is at the origin? (4)

$$X_{cm} = \frac{\sum m_i x_i}{\sum m_i} \text{ and } Y_{cm} = \frac{\sum m_i y_i}{\sum m_i}$$

$$\sum m_i = 30 \text{ g} + 40 \text{ g} + 20 \text{ g} = 90 \text{ g}$$

$$0 = \frac{\sum m_i x_i}{\sum m_i} = \frac{(30 \text{ g})(3.0 \text{ m}) + (40 \text{ g})(-2.0 \text{ m}) + (20 \text{ g})(x)}{90 \text{ g}}$$

$$\therefore x = -1.0 \text{ m}$$

$$y_{cm} = 0 = \frac{\sum m_i y_i}{\sum m_i} = \frac{(30 \text{ g})(4.0 \text{ m}) + (40 \text{ g})(-2.0 \text{ m}) + (20 \text{ g})(y)}{90 \text{ g}}$$

$$\therefore y = 0 \text{ m}$$

$$\therefore \text{For } 20 \text{ g particle } (-1.0 \text{ m}, 0.0 \text{ m})$$

Surname, Name \_\_\_\_\_

QUESTION 3

(20)

3.1 A 10 gram bullet moving 1 000 m/s strikes and passes through a 2.0 kg block initially at rest, as shown. The bullet emerges from the block with a speed of 400 m/s. To what maximum height will the block rise above its initial position? Show all steps and arguments/reasoning. (10)

Diagram: A bullet strikes a block. The bullet's initial velocity is  $v_i = 1000 \text{ m/s}$  and its final velocity is  $v_f = 400 \text{ m/s}$ . The block's mass is  $M = 2.0 \text{ kg}$ . The bullet's mass is  $m_b = 0.01 \text{ kg}$ . The block rises to a height  $y_f$ .

Energy of system:  $E_{\text{bullet}} + E_{\text{block}}$

Block's Energy:  $E_{\text{block}}$

Conservation of momentum:

$$m_b v_i + M v_{b,i} = m_b v_f + M v_{b,f}$$

$$(0.01 \text{ kg} \cdot 1000 \text{ m/s}) + (2.0 \text{ kg} \cdot 0) = (0.01 \text{ kg} \cdot 400 \text{ m/s}) + (2.0 \text{ kg} \cdot v_{b,f})$$

$$10 = 4 + 2v_{b,f}$$

$$6 = 2v_{b,f}$$

$$v_{b,f} = 3 \text{ m/s}$$

Conservation of energy:

$$m_b v_i^2 + M v_{b,i}^2 = m_b v_f^2 + M v_{b,f}^2 + M g y_f$$

$$(0.01 \text{ kg} \cdot 1000^2) + (2.0 \text{ kg} \cdot 0) = (0.01 \text{ kg} \cdot 400^2) + (2.0 \text{ kg} \cdot 3^2) + (2.0 \text{ kg} \cdot 9.8 \text{ m/s}^2 \cdot y_f)$$

$$10 = 1.6 + 0.18 + 19.6 y_f$$

$$8.22 = 19.6 y_f$$

$$y_f = \frac{8.22}{19.6} = 0.419 \text{ m} \approx 42 \text{ cm}$$

Surname, Name \_\_\_\_\_

2.4 A carnival Ferris wheel has a 15.0 m radius and completes 5 turns about its horizontal axis every minute. What is the total acceleration of a passenger at his lowest point during the ride?

HINT: Each complete turn equals  $2\pi$  radians.

$$R = 15.0 \text{ m}$$

$$\omega = \frac{5 \text{ rev}}{1 \text{ min}}$$

$$\therefore 5 \text{ rev} \times \left( \frac{2\pi \text{ rad}}{1 \text{ rev}} \right)$$

$$1 \text{ min} \left( \frac{60 \text{ s}}{1 \text{ min}} \right)$$

$$= \frac{\pi}{6} \text{ rad/s}$$

$$\text{But at } a_{\text{net}} = a_c \text{ for } \omega$$

$$a_{\text{net}} = 0 + \frac{v^2}{R} \quad (5)$$

$$= \omega^2 R$$

$$= \left( \frac{\pi}{6} \right)^2 \cdot 15.0 \text{ m/s}^2$$

$$= 4.0115 \text{ m/s}^2 \text{ or } 4 \text{ m/s}^2$$

if the 5 rev and 1 minute are treated as known values

Th... the... is to the...

2.5 The block shown is released from rest when the spring is stretched a distance  $d$ . If  $k = 50 \text{ N/m}$ ,  $m = 0.50 \text{ kg}$ ,  $d = 10 \text{ cm}$ , and the coefficient of kinetic friction between the block and the horizontal surface is equal to 0.25, determine the speed of the block when it first passes through the position for which the spring is unstretched.

$$6. k + \Delta U_s + \Delta E_{\text{int}} \therefore 0 \text{ or}$$

G wrt k - insl - aw (i) a: hM, if: 1}... still... and (1)

$$\left( \frac{1}{2}mv_f^2 - 0 \right) + \left( 0 - \frac{1}{2}kd^2 \right) + f_k d = 0$$

since  $f_k = \mu_k F_N$  and  $F_N = mg$

$$\therefore \frac{1}{2}mv_f^2 = \frac{1}{2}kd^2 - \mu_k F_N d$$

$$v_f = \sqrt{\frac{k}{m} J^2 - 3.108 \text{ J} - 1.7}$$

$$= \sqrt{\frac{50 \text{ N/m}}{0.5 \text{ kg}} (0.1 \text{ m})^2 - 2(0.25)(9.8 \text{ m/s}^2)(0.1 \text{ m})}$$

$$= 0.11 \text{ m/s}$$

$$W_{\text{NK}} = \int_{x_i}^{x_f} F \, dx$$

$$= m \int_{x_i}^{x_f} \left( \frac{dv}{dt} \right) \left( \frac{dx}{dt} \right) dt = m \int_{v_i}^{v_f} v \, dv$$

the CL.L. ...

$$\Rightarrow W = \int_{t_i}^{t_f} v \, dv$$

after ...

$$= m \left[ \frac{v^2}{2} \right]_{t_i}^{t_f} = \frac{1}{2} m v_f^2 - \frac{1}{2} m v_i^2$$

$$= \frac{1}{2} m v_f^2 - \frac{1}{2} m v_i^2$$

The ...

23 If  $M = 60 \text{ kg}$ , what is the tension in string 1? Show all the details and support all your claims or assertions with physics arguments!

$$\sum F_x = 0$$

$$\sum F_y = 0$$

$$\Rightarrow T_1 \sin 30^\circ = T_2 \sin 60^\circ$$

$$\Rightarrow T_1 = \frac{T_2 \sin 60^\circ}{\sin 30^\circ}$$

$$\Rightarrow T_1 = \frac{58.8 \text{ N} \cdot \sin 60^\circ}{\sin 30^\circ} = 101.9 \text{ N}$$

QUESTION 2

[25]

2.1 A particle starts from the origin at  $t = 0.0$  s with a velocity of  $6.0 \hat{i}$  m/s and moves in the xy plane with a constant acceleration of  $(-2.0 \hat{i} + 4.0 \hat{j})$  m/s<sup>2</sup>. At the instant the particle achieves its maximum positive x coordinate, how far is it from the origin?

Handwritten solution for Question 2.1:

Initial velocity:  $\vec{v}_i = 6.0 \hat{i}$  m/s  
 Acceleration:  $\vec{a} = (-2.0 \hat{i} + 4.0 \hat{j})$  m/s<sup>2</sup>

At maximum positive x coordinate,  $v_x = 0$ .

Using  $v_x = v_{ix} + a_x t$ :

$$0 = 6.0 + (-2.0)t \Rightarrow t = 3.0 \text{ s}$$

Using  $x = v_{ix} t + \frac{1}{2} a_x t^2$ :

$$x = (6.0)(3.0) + \frac{1}{2}(-2.0)(3.0)^2 = 9.0 \text{ m}$$

Using  $y = v_{iy} t + \frac{1}{2} a_y t^2$ :

$$y = 0 + \frac{1}{2}(4.0)(3.0)^2 = 18.0 \text{ m}$$

Distance from origin:

$$r = \sqrt{x^2 + y^2} = \sqrt{(9.0)^2 + (18.0)^2} = 20.1 \text{ m}$$

2.2 A net force,  $\Sigma F$ , is acting on a block of mass,  $m$ , and accelerates it from an initial velocity,  $v_i$ , to a final velocity  $v_f$ . The acceleration,  $a$ , is uniform and the block undergoes a displacement  $\Sigma x$  in the x axis over a flat and frictionless surface. Show that the work done by the net force is equal to the change in kinetic energy of the block. That is, derive the Work-Kinetic Energy Theorem. Show all your steps and reasoning. (5)

Handwritten derivation for Question 2.2:

Work done by net force:  $W = \int \vec{F} \cdot d\vec{x}$

Since  $\vec{F} = m\vec{a}$  and  $\vec{a} = \frac{d\vec{v}}{dt}$ :

$$W = \int \vec{F} \cdot d\vec{x} = \int m \frac{d\vec{v}}{dt} \cdot d\vec{x}$$

Using  $d\vec{x} = \vec{v} dt$ :

$$W = \int m \frac{d\vec{v}}{dt} \cdot \vec{v} dt = \int m \vec{v} \cdot d\vec{v}$$

Integrating from  $v_i$  to  $v_f$ :

$$W = \frac{1}{2} m v_f^2 - \frac{1}{2} m v_i^2 = \Delta K$$

Surname, Name \_\_\_\_\_

# QUESTION 1

[9]

1.1 A rocket, initially at rest, is fired vertically with an upward acceleration of  $10 \text{ m/s}^2$ . At an altitude of  $0.50 \text{ km}$ , the engine of the rocket cuts off. What is the maximum altitude it achieves? (4)

$$v_{if} = \sqrt{2 a y_2} = \sqrt{2 (10 \text{ m/s}^2) (500 \text{ m})} = 100 \text{ m/s}$$

$$v_{if} = v_{if} + a_2 t$$

$$0 = 100 \text{ m/s} - (10 \text{ m/s}^2) t$$

$$\therefore t = \frac{100 \text{ m/s}}{10 \text{ m/s}^2} = 10 \text{ s}$$

$$h_d = y_{if} - v_{if} t + \frac{1}{2} a_2 t^2$$

$$= (100 \text{ m/s}) (10 \text{ s}) + \frac{1}{2} (-10 \text{ m/s}^2) (10 \text{ s})^2$$

$$= 500 \text{ m} - 500 \text{ m} = 0 \text{ m}$$

$$\text{Max height} = h_1 + h_2 = 500 \text{ m} + 0 \text{ m} = 500 \text{ m}$$

1.2 If  $\vec{C} = [2.5 \text{ cm}, 80^\circ]$ , i.e., the magnitude and direction of  $\vec{C}$  are  $2.5 \text{ cm}$  and  $80^\circ$ ,  $\vec{D} = [3.5 \text{ cm}, 120^\circ]$ ,

and  $\vec{E} = \vec{D} - 2\vec{C}$ , what is the direction of  $\vec{E}$  (to the nearest degree)?

$$C_x = C \cos \theta = 2.5 \cos 80^\circ = 0.43$$

$$C_y = C \sin \theta = 2.5 \sin 80^\circ = 2.43$$

$$D_x = D \cos \theta = 3.5 \cos 120^\circ = -1.75$$

$$D_y = D \sin \theta = 3.5 \sin 120^\circ = 3.03$$

$$\vec{E} = \vec{D} - 2\vec{C}$$

$$E_x = D_x - 2C_x = -1.75 - 2(0.43) = -2.61$$

$$E_y = D_y - 2C_y = 3.03 - 2(2.43) = -1.83$$

$$E = \sqrt{E_x^2 + E_y^2} = \sqrt{(-2.61)^2 + (-1.83)^2} = 3.15 \text{ cm}$$

$$\theta = \tan^{-1} \left( \frac{E_y}{E_x} \right) = \tan^{-1} \left( \frac{-1.83}{-2.61} \right) = 35^\circ$$

$$\therefore \text{Direction of } \vec{E} = 35^\circ + 180^\circ = 215^\circ$$

Examiners: Mr MJ Legodi  
Moderator: Prof WE Meyer

Date: 21 June 2023  
Time: 15h00 to 18h00

**Total 71**

## The following specific rules apply to this Test/Examination

1. Fill in your details at the bottom of every page.
2. Answer all questions **ONLY** in the spaces provided. If you need more space, use the “overflow pages” at the back of the question paper and clearly indicate where each question continues. Ask for more overflow pages from invigilators if you require more. No work outside these guidelines will be marked!
3. Pocket calculators may be used, but programmable calculators, cellphones, earphones, electronic watches and other such devices are prohibited.
4. This paper may not be taken out of the test/examination venue. It must be handed in to the chief invigilator, before you leave the venue.
5. Work written in pencil will not be marked. **Write in black permanent pen.**
6. Provide labelled sketches, including co-ordinate systems, free-body diagrams, final answers with correct significant figures and units, etc. Marks will be lost, otherwise.
7. Your answer needs to be written in a systematic and logical fashion. You must show that you understand and can use the relevant Physics. Only substitute numerical values in the final step of calculations! A correct answer does not mean that you will receive full marks.
8. Units must be used when values/numbers are substituted, else marks will be deducted.
9. Extra points will be awarded for high quality or elegant answers.
